SmartShield Client with System Control Center Manager Client

Many customers have requested that Smart Shield have functionality to work with System Control Center Manager (SCCM). We have found that Smart Shield's entire disk protection makes running updates in protected mode impossible to manage. The solution we have devised for SCCM managed machines is to stop all SCCM updates from running while protected, then allow SCCM updates when unprotected. This will allow users to schedule a maintenance window via the Smart Control so that updates can run. This eliminates the possibility of updates being run then removed on protected client machines.
