

## How to use remote upgrades (version 2.1.7 and above)

As of version 2.1.7, SmartControl allows you to do remote software upgrades on your SmartShield client computers. This allows you to push down updates from your SmartControl Resource Manager without having to touch each machine. In order to do this, follow the steps below:

- Go to <http://www.centuriontech.com/> and log in to the customer downloads area.
- Download the 32-bit and 64-bit "Product Updater" on your SmartControl computer.
- Open SmartControl and go to "File" > "Import Update File". Point this at the 32-bit and 64-bit files. You will receive a confirmation dialog box that states, "Update file successfully imported".
- Highlight your client computers and go to "Client Control" > "Update Management" > "Update via SmartControl" and enter your password. This tells your SmartShield clients to point to your SmartControl for any updates you send down.
- Highlight your client computers that you want to update and go to "Client Control" > "Update Management" > "Update Settings". Press the "Run Now" button on your bottom left. NOTE: This will only work if your client machines are UNPROTECTED and will require a reboot.
- Once your client computers have updated to the newest version, please update your SmartControl console. NOTE: This will require a reboot!

## Local Client Upgrade

- Go to <http://www.centuriontech.com/> and log in to the customer downloads area.
- Download the 32-bit and 64-bit "Product Updater"
- Double click the file to run update
